KALSIS® capsules

helps combat rheumatoid arthritis,
osteopenia, and osteoporosis

KALSIS® is a very effective natural preparation with lactobacillus acidophilus and selenium.

KALSIS® eliminates rheumatoid arthritis pain and is essential for the control and prevention of osteopenia and osteoporosis.

The active principles of **KALSIS®** are subjected to the process of molecular activation. This process enhances the effectiveness of the product and brings about a quicker reconstruction of bone mass.

Lactobacillus acidophilus and **selenium**, upon creating synergy due to the process of molecular activation, produce the so-called **Protein Complex of Organic Selenium**, which:

- Assists calcium absorption and metabolism.
- Has an affinity for the mitochondrial matrix of the bone cells, where it increases the reconstruction and mineralization of the bone matrix.
- Reduces bone resorption and weakening.

• **eliminates joint pain from the first month**

Moreover, **KALSIS®** contains specific antioxidants to reduce oxidative stress which impedes proper functioning of the metabolism of the osteoblasts and osteoclasts, thus balancing bone formation and resorption.

KALSIS® increases bone mass in 3 months, with results observed from the third day in the fast growth of the nails and after 3 months by bone densitometry.

KALSIS® is the best solution to increase the reconstruction of bone mass in osteopenia and avoid its progression to osteoporosis.

Containers with 30 and 90 capsules of 500 mg

activated lactobacillus acidophilus and selenium

Calcium Gluconate, Magnesium Gluconate, Citrus Fibre, Lactobacillus Acidophilus, Oat Bran, Vitamin C, Vitamin E, Selenium-Rich Yeast.

How does KALSIS® work?

- increases bone mass
